

Workflow Automation

Tracking Product Reviews From App Store

By Sparsh Ganwani

What's The Automation About

Why It's Useful

- Provides **real-time, unbiased** insight into user sentiment from a high-signal channel: app reviews.
- Surfaces **weekly trends**, helping teams prioritize issues and opportunities faster.
- Enables **data-driven decision-making** without manual review cycles.

Who Is It For

- **Product & UX Teams** – to monitor feature-level sentiment and identify usability issues.
- **Customer Support & Trust/Safety** – to detect emerging user pain points early.
- **Marketing & Comms** – to understand public perception and inform messaging.
- **Leadership** – to track overall app health and user trust signals.

Benefits

- Eliminates manual review, **saving hours of operational overhead** weekly.
- Scales effortlessly as review **volume grows**.
- Reduces risk of missed critical feedback by maintaining **continuous monitoring**.

What This Enables

- **Faster iteration** cycles
- **Early detection** of regressions
- **Better alignment** between teams on user needs
- Enhanced focus on **feature quality & user experience**

Tool Stack

AppFollow — Review Ingestion

A review monitoring platform that triggers an event whenever a new App Store / Play Store review is posted.

Used For:

- To capture **review text, rating, and metadata** in real time and pass it into Zapier for processing.

AI by Zapier (GPT-4o mini) — Analysis & Report Generation

Zapier's AI step powered by GPT-4o mini

Used For:

- **Sentiment analysis** of individual reviews
- Generating **sentiment scores + reasoning**
- Creating the **weekly summary report** (themes, tone, insights, recommendations)

Google Sheets — Data Storage Layer

Acts as the structured database for all processed reviews.

Stores:

- Timestamp
- Rating
- Review text
- Sentiment classification + score
- AI-generated reasoning

Enables weekly filtering and batch processing.

Schedule by Zapier — Weekly Automation Trigger

A built-in Zapier scheduler.

Used For:

- Used to automatically run the **weekly summary workflow** every Monday, pulling past week's data without manual intervention.

Google Docs — Report Generation Storage

Used to **store the AI-generated weekly sentiment report** in a clean, readable document.

Serves as the **single source of truth** for stakeholders.

Gmail — Report Distribution

Automatically sends an **email** to relevant stakeholders with the **Google Docs report link**. Ensures consistent, timely delivery every week.

How AI Is Used

Use Case Category

Sentiment Analysis of Individual Reviews

Text Classification & Structuring

Thematic Clustering & Pattern Detection

Tone & Experience Evaluation

Insight & Recommendation Generation

Impact

AI (GPT-4o mini via AI by Zapier) analyzes every new review and classifies it as:

- Positive / Neutral / Negative
 - Assigns a **sentiment score**
 - Provides textual **reasoning** explaining the classification
-

AI extracts and organizes information from raw reviews, enabling: Positive / Neutral / Negative

- Consistent **labeling**
 - Standardized **scoring**
 - Structured storage in Google Sheets
-

During the weekly summary process, AI identifies:

- **Common themes** across the week
 - Emerging issues or feature requests
 - **Repeated patterns** in user feedback
-

AI assesses the overall **user tone** for the week, detecting whether sentiment trends are improving or declining.

Supports **week-over-week trend** monitoring

AI produces a weekly narrative summarising:

- Key insights
- User pain points and delight drivers
- Actionable recommendations for Product, UX, and Support teams

Edge Cases and Human-In-The-Loop (HITL)

If AppFollow fails to capture a review or Google Sheets hits row limits, parts of the workflow may break.

Incomplete or Missing Data Inputs

Monitoring is needed to ensure data flow remains intact

AI can suggest improvements based on patterns

Recommendations Require Judgment

But prioritization and trade-off decisions still require product and UX teams to validate context and impact

Reviews with mixed languages, slang, typos, or shorthand can reduce model accuracy

Non-English or Poorly Written Reviews

May require manual interpretation for correct classification

Immediately after a big feature launch or UI update, the tone may change in unpredictable ways

Rapid Shifts After Major Releases

AI may need human validation to ensure themes and recommendations are accurate
